Field Veterinary & Crop Pathology Report

Comprehensive Diagnostic Records • Unobstructed Clinical Documentation • Ref: [DOC-2026-004]

This report documents active surveillance data collected across regional livestock and crop production sites. All photographs and clinical records are presented without text overlays, digital watermarks, or obscuring elements to ensure complete visibility of pathology, lesion morphology, and diagnostic indicators.

1. Livestock Pathology: Small Ruminants & Swine

Fig 1.1: Caprine mucopurulent nasal discharge & severe lip/perinasal lesions.

Clinical Finding: Profuse mucopurulent discharge, erosive stomatitis, and crusting dermatitis around the labial commisures. Note the absence of overlays on the affected tissue interface.

Fig 1.2: Porcine acute presentation with cyanotic extremities.

Clinical Finding: Widespread cutaneous hyperaemia, cyanosis of the pinnae (cyanotic ears), and ventral blotching characteristic of acute viral hemorrhagic syndrome.

Fig 1.3: Bovine infectious keratoconjunctivitis & submandibular edema.

Clinical Finding: Corneal opacity, active epiphora, and prominent submandibular soft tissue swelling.

Fig 1.4: Avian respiratory distress & facial swelling.

Clinical Finding: Severe conjunctival swelling, depression, and posture changes indicative of acute respiratory infection.

2. Agronomic Crop Pathology: Fungal & Bacterial Infections

Fig 2.1: Solanum lycopersicum leaf necrosis & fruit rot.

Pathology: Advanced necrotic lesioning with characteristic white sporulation margins on leaf tissue alongside sunken, brown-black concentric fruit lesions.

Fig 2.2: V-shaped chlorosis and black vein necrosis in Brassica oleracea.

Pathology: Systemic vascular colonization resulting in marginal chlorotic V-lesions with darkened, plugged vascular strands clearly visible.

3. Specialized Field Crop Anomalies

Fig 2.3: Concentric target lesions on vegetative onion foliage.

Pathology: Oval-to-elongated purple lesions with distinct chlorotic halos, showing full structural integrity without obstructions.

Fig 2.4: Severe galling and tissue cracking on root vegetable storage organs.

Pathology: Extensive hyperplasia, multinucleate giant cell formation, and secondary splitting clearly exposed across the primary root axis.
